

NTE7081 Integrated Circuit RGB Video Amplifier System

Description:

The NTE7081 is a wideband video amplifier system in a 28-Lead DIP type package intended for high resolution RGB color monitor applications. In addition to three matched video amplifiers, the NTE7081 contains three gated differential input black level clamp comparators for brightness control and three matched attenuator circuits for contrast control. Each video amplifier contains a gain set or "Drive" node for setting maximum system gain ($A_V = 4$ to 10) as well as providing trim capability. The NTE7081 also contains a voltage reference for the video inputs.

Features:

- Three Wideband Video Amplifiers (70MHz @ -3 dB)
- Inherently Matched (± 0.5 dB) Attenuators for Contrast Control
- Three Externally Gated Comparators for Brightness Control
- Provisions for Independent Gain Control (Drive) of each Video Amplifier
- Video Input Voltage Reference
- Low Impedance Output Driver

Absolute Maximum Ratings:

| | |
|--|-------------------------------|
| Supply Voltage (Pin1, Pin13, Pin23, Pin28, Note 1), V_{CC} | 13.5V |
| Voltage at Any Input Pin, V_{IN} | $V_{CC} \geq V_{IN} \geq GND$ |
| Video Output Current, I_{16} , I_{20} , or I_{28} | 28mA |
| Power Dissipation (Note 2), P_D | 2.5W |
| Junction Temperature, T_J | +150°C |
| Operating Temperature Range, T_A | 0° to +70°C |
| Storage Temperature Range, T_{STG} | -65° to +150°C |
| Thermal Resistance, Junction-to-Ambient, R_{thJA} | 50°C/W |
| Lead Temperature (During Soldering, 10sec.) , T_L | +265°C |
| ESD susceptibility | 2kV |

Note 1. V_{CC} supply pins 1, 13, 23, and 28 must be externally wired together to prevent internal damage during V_{CC} power ON/OFF cycles.

Note 2. Derate above +25°C based on R_{thJA} and T_J .

Note 3. These parameters are guaranteed and 100% tested.

Note 4. Determine V_{12} low for —40dB attenuation of output. Reference A_V to max.

Note 5. Measure gain difference between any two amplifiers. $V_{IN} = 1\text{V}_{P-P}$.

Note 6. Adjust input frequency, f_{IN} , from 10kHz (A_V max ref level) to the —3dB corner frequency (f —3dB). $V_{IN} = 560\text{mV}_{P-P}$.

Note 7. $V_{IN} = 560\text{mV}_{P-P}$ at $f_{IN} = 10\text{kHz}$ to any one amplifier. Measure output levels of the other two undriven amplifiers relative to driven amplifier to determine channel separation. Terminate the undriven amplifier inputs to simulate generator loading. Repeat test at $f_{IN} = 10\text{MHz}$ for $V_{sep} = 10\text{MHz}$.

Note 8. Special test fixture without socket required.
